

ANYDOC INVOICE

The AnyDoc vision is to offer complete 'all-in-one' solutions to specific business requirements using the right combination of their standard products. So their invoice processing offering, AnyDoc Invoice is based on AnyDoc's standard Product OCR for AnyDoc including AnyDoc's own freeform technology, AnyApp. The AnyDoc product range includes:

- **Infiniworx** - a capture workflow platform mainly used for document classification and tracking, offering state of the art automated classification, and powerful audit trail management ideal for bureaux and outsourcing specialists helping monitor SLAs etc.
- **MANAGEit** - a central management console able to monitor and manage high volume production
- **CAPTUREit** - the main, highly powerful, scan client for centralised and remote scanning
- **VERIFYit** - a remote verification client perfect for overseas outsource situations, homeworking temps and the like
- **AnyDocBusinessWorkflow**, a web-based business workflow for companies whose existing ECM or ERP System does not offer a business workflow engine.
- **EXCHANGEit** - a massively flexible interface manager, allowing feeds to FileNet, IBM ContentManager, Lifelink, DocuWare, SAP and many other ECM, DM

and ERP systems

For Invoice Processing, ease of integration between existing workflows and AnyDoc is central to AnyDoc's offering, hence the approach of 'different flavours for different customers'. Most A/P users of course will require at least scanning, import, validation and sometimes invoice specific workflow. AnyDoc Invoice offers unlimited scalability - users can implement as many scan, extract, and verify stations as they need, all controlled by MANAGEit - whether it is all done on one standalone PC, or on a distributed global network.

Central to AnyDoc Invoice is the company's free-form OCR technology, combining several different recognition technologies in a single application: it can look at data formats, keywords, database lookups, business rules, specific word combinations, logical combinations and calculated values to offer a supremely flexible and powerful data capture and verification process.

AnyDoc has its own proprietary image enhancement technology built in to optimise image quality straight from the scanner to ensure the most accurate OCR results possible. It can, for instance, enhance dot matrix printer output, and

remove background 'interference' from an image. It can also be used in combination with Kofax VRS or other technologies as required.

The interface is remarkably simple and intuitive: users are presented with options on the left of the screen dependent on their roles and tasks within the process (e.g. scan, import, review, classify, exception handling, verify, commit etc.), and user group controls can be managed using Active Directory. It is a simple matter to change views, delete or re-scan pages, combine images into multi-page documents, and much more.

Similarly, at the extraction stage the user can easily use VAT numbers to identify suppliers and automatically populate data from the ERP system, matching invoice details against orders. The beauty of AnyDoc Invoice is in the level of control it offers - with its highly customisable approach, AnyDoc can create a solution suited to almost any needs. This is a rare thing indeed - an invoice process automation solution that has been designed to accommodate users' existing A/P processes and rules, rather than force the user to 'bend' their business rules to fit the solution.
